## REUTER'S QUALITY SEEDS

Reuter's Quality Seeds are the result of critical selection by trained experts to provide only those types and strains that are best adapted to perfect development in the South. Many trials are conducted in checking the adaptability and quality of each variety. Only those of the highest merit are recommended. Our stocks are produced by specialists in various parts of the world who have made a life study of seed-breeding and seed-growing and have developed special types that respond most favorably to the soil and climatic conditions in the South.

## OUR OWN MODERN SEED LABORATORY

Every care and precaution is exercised to insure your obtaining only seeds of strongest vitality and highest germination. You may depend on Reuter's Quality Seeds producing sturdy, strong, vigorous plants. A graduate Seed Analyst, formerly with the United States Government, painstakingly analyzes every lot of seed for both purity and germination. Tests are also conducted in our own greenhouses to give us a further accurate germination percentage.

It is our sincere desire to bring to the gardens of the South more beautiful and fragrant flowers—more new, improved, and delicious vegetables, for your pleasure and profit.

Reuter hopes that he may have the opportunity of supplying the seeds, bulbs, and plants that will bring to you new life, greater joy, and more healthful recreation, and to your garden and home exquisite beauty and delicate new flowers.

Gardening time is just around the corner. Turn through these pages now. You will find everything to make your garden a success.

# 1948 FLOWER INTRODUCTIONS

MARIGOLD, French Dwarf. Red Head Bronze Medal Winner, 1948 All-America Selections

# MARIGOLD

1734 French Dwarf, Red Head. The well-shaped, single flowers are 2 inches across, made up of a single row of broad, overlapping, beautifully recurved petals and a wide, crested center of many tiny erect florets. The edges of the outer petals are slightly curled, displaying a golden reverse and adding greatly to the beauty of the flowers, which possess all the magnificent shades of gold, bronze and auburn. When the blooms start opening they are an exquisite mahoganyred, changing to auburn and later to bronze and gold. The dwarf, bushy plants grow 1 foot tall and are free blooming. Excellent for beds and borders. Pkt. 25c.

# **SNAPDRAGON**

1184 **Cherry Rose.** A new color in Snapdragons, which we believe to be the most important yet developed. Its bright shade of deep cherry-rose has long been desired. 1267 **Lemon Beauty.** Similar in characteristics to Persimmon Beauty, but of the purest lemon color. Pkt. 25c.

1268 Apricot Beauty. A far better two-toned Calendula than heretofore seen. The color is an exquisite apricot. Pkt. 25c.

# COSMOS

Striking deep rose and rich crimson, in the first bicolor Cosmos ever to be developed. The flowers are large and are borne on erect, strong stems. **Pkt. 25c.** 

# PETUNIA

# How to Grow Iris

Irises may be grown very successfully in Southern gardens if proper growing conditions are provided for them, and, in selecting the particular types that are best suited for your garden, consideration should be given to location and soil. In the planting instructions given below we have emphasized the requirements of each type,

German Irises require a well-drained, sunny location. Clay soils should be mixed to a depth of 1 foot with a liberal quantity of sharp sand. Do not plant too deep. The top of the rhizomes should be at ground-level. Use no fertilizer except Bone Meal, about a closed handful to each plant, and after planting, water thoroughly to settle soil. Cultivate the surface after each rain and water only when soil is dry. Remove old leaves as they wither sufficiently to pull them off. Proper distance between plants, 1 foot.

Louisiana Irises do equally well in sunny or partially shaded locations if properly watered. Clay soils should be loosened by spading in a liberal quantity of Peat Moss. Plant the roots about 4 inches deep and 1 foot apart. Leave them undisturbed in the ground until they are crowded for space, when they should be lifted and separated. This is best done in late summer or fall.

Japanese Irises may be grown very successfully in the South by observing a few simple rules. They prefer a sunny location, but are not adverse to semishade. In preparing your bed, spade into the soil a liberal supply of well-rotted cow manure and Peat Moss. Plant the roots 3 to 4 inches deep, and in order to provide sufficient moisture during warm weather, dike your beds so the water will not run off. Never allow the soil to dry out. Give a good soaking whenever needed.

EDITOR McFARLAND

ETOILE DE HOLLANDE

We offer California Roses grown for us by one of the largest and most reputable growers on the West Coast. All plants offered are large, hardy, 2-year-old, field-grown, budded stock, full of vigor. They have been blooming profusely this past season.

All Tea (T) and Hybrid Tea (HT) Roses are everblooming in the South. Hybrid Perpetuals (HP) are more seasonal in their blooming.

CULTURAL DIRECTIONS. Select a location where your Roses will get the sun at least 5 to 6 hours a day. They do best in a slightly acid ground and if your soil is alkaline it is advisable to give the Rosebeds an application of Aluminum Sulphate before setting out the bushes. Broadcast this material over the surface at the rate of 10 pounds per 100 square feet, and mix it into the soil by spading. For easy cultivation and cutting of flowers do not make your Rose-beds more than 3 feet wide, and set your bushes 1½ feet apart each way.

About the end of February the Rose bushes should be pruned. Cut the plants back to about 12 inches; remove all dead wood and weak and unproductive growth. Climbing Roses if cut back at all should be pruned about the beginning of July. Some growers object to severe pruning, in which case remove only the dead wood or unproductive growth.

Give your first application of plant-food about the middle of February and continue monthly until June. Apply a closed handful to each bush sprinkled over the surface and watered down.

Spraying is very necessary to protect the plants from black-spot, mildew, and insects. Tri-Ogen or Nicotine Pyrox are probably the most efficient of all the spray materials as they control the fungus and kill all types of insects.

In the spring a mulch of some kind is of great importance. Such material as Peat-Moss or Servall is suitable for this purpose. During dry weather give your Rose-bed a thorough soaking twice a week. Light daily sprinklings are of little benefit.
